hills per acre.

## "YOU WILL ENJOY EATING"

# S. N. & S. Co's. Peerless Onion Seed

(One ounce for 100 feet of drill; 4 to 5 pounds in drills per acre.)

## HOW TO GROW ONIONS FROM SEED

Sow seed as early in the Spring as the ground can be worked, in rows 1 to 1½ feet apart. Cover the seed lightly. The soil best suited to grow onions is one that is reasonably fertile, well drained, and well prepared. If fully matured onions are wanted, thin the seedlings when 3 to 4 inches tall, to stand sufficiently far apart to develop without touching one another. The largest onions are produced by sowing the seed in hotbed early in January or February and transplanting seedlings to the open ground 6 inches apart. When the bulbs have reached maturity, bend down the tops to hasten ripening.

# S. N. & S. Co.'s TENDER GREEN PEAS

(1 pounds to 100 feet of drill — 80 to 100 pounds to the acre.)

Peas are quite hardy and for early crop sow as soon as the ground can be worked. Then sow in succession every two weeks until the first of August. They require moderately rich soil but not too rich. Plant the dwarf varieties in rows 12 to 18 inches apart, and the tall varieties 3 feet apart. The tall varieties should be staked. By using various types and making several sowings of each, good Peas can be had for a long season. For late sowing, use Early Dwarf Varieties.

Do you know how to avoid the usual disappointment of a poor Pea crop after mid-July? It is easy to get a big crop of juicy Peas even up to late August. Instead of planting at two- or three-week intervals get Long-Lasting Pea Garden and plant all at the same time in early Spring. This will allow a good root system to develop before hot weather comes. The varieties will bear in the order shown to late August.

Gibberell-Fix increases plant size 3 to 5 times in height in 2 to 3 weeks. It makes bushier plants, increases the number of blooms and stimulates earlier blooming. It also speeds up seed germination, breaks the dormancy cycle and reduces transplanting shock. No one knows yet all the horticultural miracles Gibberell-Fix can work. Be your own research scientist. ## "Nodampoff" SPHAGNUM MOSS IS THE SENSATION OF THE HORTICULTURAL WORLD

This sure, successful method of germinating and growing seeds, bulbs and house plants has been used for many years by professional growers only. Now it is being made available for home use. This product is fool-proof. Any person who follows simple directions can now produce high yields of flowers, vegetables and bulbs in ordinary pots and pans.

This versatile product works like magic, without constant care, and without the use of chemical protectants to safeguard seeds and seedlings from diseases. It will germinate seeds faster and safer than any other medium.

Milled Sphagnum moss is highly recommended by the U. S. Department of Agriculture, as well as thousands of growers and nurserymen, as the finest germinating and growing medium.

No need to sterilize Sphagnum to kill damping off fungi (that's what causes your baby plants to get limber necks and die by the hundreds). Treated "Nodampoff" Sphagnum is sure poison for damping off. No need for daily watering; soak the moss and forget it for a few days. Handy to sow. Drop seeds on top of moss, that's all. Better root systems on your plants with "Nodampoff" treated sphagnum moss and the roots come out whole, not broken off.

"Nodampoff" Sphagnum Moss is used to germinate and grow thousands of varieties of seeds and plants, including these:

Double Petunias, Azaleas, Delphiniums, Snapdragons, Marigolds, Zinnias, Pansies, Cabbages, Peppers, Tomatoes, Conifers and other annuals, perennials too numerous to mention.

This product is also successfully used to root cuttings of Ivy, Begonias, Geraniums, Gloxinia, African Violets and many others. Also use mixed with soil to correct alkali conditions.

Available in bags containing about 5 quarts, Wt. 10 ounces — \$1.25 Postpaid.

## BACCTO PEAT

\* *It's Bacti-vated!*  
BACTERIALLY ACTIVE \*TRADE MARK REG.

### "NATURE'S FINEST ORGANIC SOIL CONDITIONER"

#### What Is the Value of PEAT in Gardening?

Peat is organic matter. As it decays it releases beneficial bacteria. It increases the capacity of the soil to retain moisture. When mixed into soil peat gives it the ideal physical structure for growth of plant life. Physical structure of the earth is just as vital to growing things as plant food. Peat binds sandy soils, loosens clay soils, improves all soils. Peat makes fertilizer more effective by storing it up in tiny fibrous cells and then releasing it slowly to plant roots. Used as a mulch in summer, peat keeps the ground from caking and makes cultivation unnecessary. It keeps roots cool and moist during intense heat.

#### Why Is "Bacti-vated" BACCTO PEAT a Vitalizing Force in Soil?

BACCTO PEAT is aerated and processed to build up its naturally high count of beneficial bacteria. This bacteria converts raw chemical fertilizers into a form that is digestible to plant roots. Helps to release plant food locked up in soil.
